Reeder and Felson's Gamuts in Radiology

Neurology is primarily characterized by a variety of diseases which seem very similar and are therefore difficult to distinguish between. Skill at differential diagnosis is therefore absolutely paramount. Neurological Differential Diagnosis is a streamlined handbook of prioritized differential diagnosis, to be used both in clinical practice and for exam review. By presenting differential diagnosis in order of frequency and importance, this book provides a practical handbook for clinicians in training, as well as a potential resource for quick board review. Whilst the book covers the most important syndromes and disease entities, readers are referred to other texts for more exhaustive differentials. By limiting differentials in this way - to the most likely and most serious diagnoses - the reader can more easily recall relevant disease processes when faced with a particular clinical situation, whether it be a patient in the emergency room or a difficult question on the board examination. The book specifically targets neurology residents and fellows, with overlap to neurosurgery and psychiatry. Internal medicine physicians with an interest in neurological problems and medical students looking for an edge in clinical neuroscience would also benefit from this text. The content is primarily mid-level material, in a pedagogic format. In order to organize the students' thought processes concise tables and line drawing templates are included. The book is organized into broad chapters by type of disorder and some overlap occurs between particular chapters.

This book contains essential dermatologic diagnostic information innovatively organized around traditionally classified skin lesions. Part One contains both a morphological and regional approach to the differential diagnosis of lesions, with diseases subclassified according to characteristics (vascular, infectious, and so on), as well as a separate section on pediatric differential diagnosis. Part Two, The Pearls, aids differentiation by providing new approaches to diagnosis. It groups skin diseases and lesions with other disorders and with systemic diseases, drug-related diseases, malignancies, and special conditions (nutritional disorders, pregnancy, and others). Part two also highlights the pathognomic features of diseases, common allergens, vectors, and incubation periods of diseases. The book's alphabetical arrangement within sections and carefully constructed subclassifications create a store of easily accessed, essential information for all dermatologists, including residents, clinicians, and academicians.
