So, today, we will focus on the anatomy of movement rather than exploring the conscious working of the mind. Our bones, muscles and joints are the main elements of our body that functions in movement. They are all amazingly efficient structures. The muscles are key to anatomy of movement because they supply the force and direction for the movement.

The primary motor cortex (M1) lies along the precentral gyrus, and generates the signals that control the execution of movement. Secondary motor areas are involved in motor planning.

Anatomy of Movement presents a dynamic, integrated approach to the study of the physical structures of the musculoskeletal system and their functional relationship to the movements of the human body.

There are many types of movement that can occur at synovial joints (Table 1). Movement types are generally paired, with one being the opposite of the other. Body movements are always described in relation to the anatomical position of the body: upright stance, with upper limbs to the side of body and palms facing forward.

During this English-language module, we will immerse in the signature components of the Anatomy of Movement® method to discover the dynamic interactions that involve the spine, the lower limbs and upper limbs. We use analysis, group work + asana observation to craft a practical and creative foundation of anatomy skills for yoga teachers.

The movement is carried out around a fixed axis or fulcrum and has a direction. Anatomical movements are no different. They usually involve bones or body parts moving around fixed joints relative to the main anatomical axes (sagittal, coronal, frontal, etc.) or planes parallel to them.

The movements produced at joints by muscles are given specific anatomical

names, often referred to as “anatomical terms of motion”. We usually make the assumption that the body is in normal resting anatomical position, and that joint movement occurs from this resting position.
