access the network: mail, telnet, ftp, and news readers. But it also does much more. The Guide pays close attention to several important information servers (Archie, Wais, Gopher) that are, essentially, databases of databases: they help you find what you want among the millions of files and thousands of archives available. There's also coverage of the World Wide Web. We've also included our own database of databases: a resource index that covers a broad selection of several hundred important resources, ranging from the King James Bible to archives for USENET news. So if you use the Internet for work or for pleasure -- or if you'd like to, but don't know how -- you need this book. If you've been around the Net for a few years, you'll still be able to discover resources you didn't know existed. Also includes a pull-out quick-reference card. Now more comprehensive than ever, here's what you will find in the second edition: An expanded, easy-to-use resource catalog. New and experienced users alike can refer to the catalog to discover what's available on the Net. Descriptions of three resources that serve as the Internet's "card catalog": InterNIC, GNN, and Almanac (what they are, what they're for). An explanation of multimedia mail (MIME): what it means, how to deal with it. An introduction to pine, a popular mail program that supports MIME. More on ftp-mail servers, and different kinds of mailing list managers, including Majordomo and Almanac. An introduction to xarchie, a popular X-based Archie client with an FTP client built-in, along with other improvements to the Archie service. What's new in the "white pages," or the Internet's telephone book. In particular, the book covers Netfind. An introduction to tin, another popular newsreader. New features of Gopher, including

Focusing on the fundamentals of wireless communications and networking, this book introduces readers to an overview of the salient features of first and second generation wireless cellular systems, and those perceived for the third generation, with a road map. It identifies the problems that cause information loss in point-to-point signal transmission through the wireless channel, and discusses techniques suitable for minimizing the information loss. With an acceptable transmission quality, the text proceeds to cover wireless communications in a cellular setting, treating the ramifications in terms of capacity maximization, support for multi-user transmissions, mobility management to facilitate user roaming, and global information delivery through wireless/wireline interworking. For individuals beginning their study of electrical and computer engineering.

This is a discussion of the relationship between one group of Singapore Chinese and their ancestral village in Fujian in China. It explores the various reasons why the Singapore Chinese continue to want to maintain ties with their ancestral village and how they go about reproducing Chinese culture (in the form of ancestor worship and religion) in the village milieu in China. It further explores the reasons why the Singapore Chinese feel morally obliged to assist their ancestral village in village reconstruction (providing financial contributions to infrastructure development such as the buildings of roads, bridges, schools, hospitals) and to help with small scale industrial and retail activities. Related to this is how the village cadres and teenagers, through various strategies, managed to encourage the Singapore Chinese to revisit their ancestral village and help with village reconstruction, thereby creating a moral economy. The main argument here concerns the desire of the Singapore Chinese to maintain a cultural identity and lineage continuity with their ancestral home.
