dependence of the Monarch butterfly on its host plants is chosen as an example of plant-animal coevolution in action. The ability to isolate trace amounts of a substance from plant tissues has led to a wealth of new research, and the fourth edition of this well-known text has consequently been extensively revised. New sections have been provided on the cost of chemical defence and on the release of predator-attracting volatiles from plants. New information has been included on cyanogenesis, the protective role of tannins in plants and the phenomenon of induced defence in plant leaves following herbivory. Advanced level students and research workers alike will find much of value in this comprehensive text, written by an acknowledged expert on this fascinating subject. physiology, and clinical care. The strength of Mark's Basic Medical Biochemistry is that it starts with the patient—the metabolic and nutritional needs of the human body (easy for students to understand)—as opposed to explanations of complex chemical theory. Mark's Basic emphasizes clinical correlations throughout the text and links biochemical concepts to physiology and pathophysiology, using patient vignettes as the context. These specific and memorable mock patient cases are followed throughout the chapter to pose questions, illustrate core concepts, and help students remember and apply biochemical principles within the context of clinical practice.

"The chemical reactions of living systems take place across a wide range of conditions. Although many microbial species can tolerate extreme heat, multicellular organisms require much more temperate habitats. One exception is *Alvinella pompejana*, the Pompeii worm, which lives near deep-sea hydrothermal vents and thrives at 42 ÅC (107 ÅF). Hair-like colonies of symbiotic bacteria may help insulate its body"--
