Stem Cells

This text offers a fresh, distinctive approach to the teaching of molecular biology that reflects the challenge of teaching a subject that is in many ways unrecognizable from the molecular biology of the 20th century - a discipline in which our understanding has advanced immeasurably, but about which many questions remain to be answered. With a focus on key principles, this text emphasizes the commonalities that exist between the three kingdoms of life, giving students an accurate depiction of our current understanding of the nature of molecular biology and the differences that underpin biological diversity.

Cell and Molecular Biology

The Problems Book helps students appreciate the ways in which experiments and simple calculations can lead to an understanding of how cells work by introducing the experimental foundation of cell and molecular biology. Each chapter reviews key terms, tests for understanding basic concepts, and poses research-based problems. The Problems Book has been

The Contento Experimental Cell Biology Lab Book is a modular design that matches the topics

discussed in Karp's textbook. The manual itself consists of 30+ experiments that coincide and complement each of the 18 chapters in the Karp text. There are three possible designs of the lab book, based on the instructor's needs. These designs focus on either Techniques, Concepts, or Organelles. The procedures of the 30+ experiments remain standard and unchanged in all designs of the lab book. Special Overview pages, Discussion Questions and Datasheets bookend the procedures in order to create each of the possible textbook designs. This gives instructors flexibility to create a lab book that suits their lecture course curriculum, their experience, and available equipment and supplies.

Humankind's fascination with the animal kingdom began as a matter of survival – differentiating the edible from the toxic, the ferocious from the tractable. Since then, our compulsion to catalogue wildlife has played a key role in growing our understanding of the planet and ourselves, inspiring religious beliefs and evolving scientific theories. The book unveils wild truths and even wilder myths about animals, as perpetuated by zoologists – revealing how much more there is to learn, and unlearn. Animals were among the first subjects ever drawn by humans. Long before Darwin or Watson and Crick, our ancestors studied the visual similarities and differences between the creatures which inhabit the Earth alongside us. Early savants could sense there was an order, a scheme, which unified all life. The schemes they formulated often tell us as much about ourselves as they do about the animals depicted, highlighting obsessions, fears, revelations and hopes. The human quest to classify living beings has left us with a rich artistic legacy in four great stages—the folklore and religiosity of the ancient and Medieval world; the naturalistic cataloging of the Enlightenment; the evolutionary trees and maps of the nineteenth century; and the modern, computer-hued classificatory labyrinth. The aim of this book is to tell the story of our systematization of the beasts. These charts of the zoological world parallel prevailing artistic trends and scientific discoveries, woven together with philosophical threads that run throughout: animal life as parable, a tree, a maze, a terra incognita, a mirror upon ourselves.
