Mastery of these skills requires extensive, specialized tactical emergency medical services (TEMS) training and experience in the tactical environment. Designed for EMS and medical professionals of all levels of training, *Tactical Medicine Essentials* provides the foundation needed to create world-class TMPs. Written by an experienced team of authors from diverse backgrounds, this text covers the essential curriculum of tactical medicine, including tactical patient assessment, expedient extrication and evacuation, and self-defense skills. Orthopedic Nursing Secrets

In the past decade, few subjects at the intersection of medicine and sports have generated as much public interest as sports-related concussions - especially among youth. Despite growing awareness of sports-related concussions and campaigns to educate athletes, coaches, physicians, and parents of young athletes about concussion recognition and management, confusion and controversy persist in many areas. Currently, diagnosis is based primarily on the symptoms reported by the individual rather than on objective diagnostic markers, and there is little empirical evidence for the optimal degree and duration of physical rest needed to promote recovery or the best timing and approach for returning to full physical activity. *Sports-Related Concussions in Youth: Improving the Science, Changing the Culture* reviews the science of sports-related concussions in youth from elementary school through young adulthood, as well as in military personnel and their dependents. This report recommends actions that can be taken by a range of audiences - including research funding agencies, legislatures, state and school superintendents and athletic directors, military organizations, and equipment manufacturers, as well as youth who participate in sports and their parents - to improve what is known about concussions and to reduce their occurrence. *Sports-Related Concussions in Youth* finds that while some studies provide useful information, much remains unknown about the extent of concussions in youth; how to diagnose, manage, and prevent concussions; and the short- and long-term consequences of concussions as well as repetitive head impacts that do not result in concussion symptoms. The culture of sports negatively influences athletes' self-reporting of concussion symptoms and their adherence to return-to-play guidance. Athletes, their teammates, and, in some cases, coaches and parents may not fully appreciate the health threats posed by concussions. Similarly, military recruits are immersed in a culture that includes devotion to duty and service before self, and the critical nature of concussions may often go unheeded. According to *Sports-Related Concussions in Youth*, if the youth sports community can adopt the belief that concussions are serious injuries and emphasize care for players with concussions until they are fully recovered, then the culture in which these athletes

perform and compete will become much safer. Improving understanding of the extent, causes, effects, and prevention of sports-related concussions is vitally important for the health and well-being of youth athletes. The findings and recommendations in this report set a direction for research to reach this goal.

Sports-related Fractures, Dislocations and Trauma

Although trauma victims constitute around one-tenth to one-eighth of the total patient volume in hospital emergency departments, the burden of trauma on humankind is beyond these statistics. The twenty-first century is witnessing a growing threat on human beings imposed by many sources, namely natural disasters, terrorism and other conflicts, warfare, and transportation accidents; all of which ignite the rise of major trauma incidents worldwide. Physicians, therefore, get involved in trauma management more and more frequently in time. They need to evaluate, diagnose, treat, and stabilize victims and help them take part in active and productive life as soon as possible. Technological advances have provided many techniques to augment trauma care and resuscitation, fracture healing, wound care, casts and splints, sutures, and transfusions. However, the successful management of trauma warrants a collaboration of emergency medicine, surgical disciplines, intensive care medicine, and almost all the resources of a hospital. This work is an example of a multidisciplinary approach that is a must to maximize synergistic efforts to deliver contemporary care for trauma victims of all ages throughout the world.

Every case that athletic trainers respond to is unique, but by exposing themselves to a variety of scenarios, they can be prepared for almost any situation. Case studies are the easiest way to find this information, but oftentimes, they come in the form of informal anecdotes or only relate to very specific subjects. Athletic Training Case Scenarios: Domain-Based Situations and Solutions is designed to fill this gap by providing a large number of studies from all five of the domains of athletic training. Keith M. Gorse, Francis Feld, and Robert O. Blanc have gathered true-to-life scenarios for each of the five domains of athletic training, resulting in expert advice on the best response to many possible scenarios. These scenarios were shared by the certified athletic trainers who originally responded to them coming from their work in industrial settings, high schools, colleges, professional teams, and sports medicine clinics. Each scenario features the actual case as it was first assessed by the athletic trainer in order to give readers an opportunity to use their own judgment and decide the best course of action before the original athletic trainer's own response and recommendations are given. Organized by domain, readers will be able to easily find examples of any case they could imagine. Each domain (prevention, evaluation and diagnosis, emergency care, treatment and rehabilitation, and organizational and professional health) has over a dozen scenarios designed to encourage critical thinking. This format gives readers the closest thing to a crash-course by exposing them to a diverse array of cases and situations. Athletic training students and clinicians will appreciate the wide range of cases presented in Athletic Training Case Scenarios: Domain-Based Situations and Solutions, providing them with the strong knowledge base they will need to respond to any situation they may experience themselves.
